

**AMENDMENTS TO THE ABSTRACT:**

Please amend page 10, paragraph 2, to read as follows:

**ABSTRACT OF THE DISCLOSURE**

An endoscopic surgery device for the insertion and recovery of a haemostatic plug at the surgical site. The device comprises a tubular body suitable for slidingly housing the plug, and a plunger slidingly engageable within the tubular body so as to push the plug outside the body, and to position it at the surgical site. The plug is connected to a locator that is radio-opaque, has a suitable color, and has a specific weight that allows it to float relative to the internal organs, blood or other fluids present at the surgical site. At A loop is provided at a distal end of the plunger, a and at a proximal end of the plunger, a first handle is provided for gripping the locator and recovering actuating the plunger so as to grip the ball and recover the plug after use, as well as by retracting the plunger into inside the tubular body.
